SUMMARY OF VISIT

On 3rd December 2025, students of Data Engineering SECPH attended a visit to UTHM's Data Center. We were briefed about the data center regarding how it worked and what are the structures and technologies implemented inside it. We were accompanied by professionals from UTHM that maintained the data center on how the Enterprise Architecture inside the UTHM implemented to gather sources for our upcoming project. The outcome of the visit was the knowledge that bridge the gap between our theoretical knowledge of system modeling and the physical reality of enterprise data management.

TECHNOLOGIES DISCUSSED : DATA CENTER

- **Hot & Cold Aisle Containment:** Implemented to optimize cooling efficiency by physically separating cold air supply from hot exhaust, ensuring hardware longevity.
- **Data Retrieval Strategy:** discussed the hybrid use of APIs for real-time fetch requests versus bulk pull methods for handling massive datasets efficiently directly from master database.
- **Remote Management:** The entire data center is monitored and controlled remotely from a separate networking room, allowing for centralized security and maintenance.

REFLECTION

MUHAMMAD ADAM

This visit taught me that managing data requires strong physical infrastructure, like the hot and cold aisle cooling systems we saw. I also realized that Enterprise Architecture is a complex process, as UTHM is still working on fully implementing their enterprise system. Overall, seeing the remote monitoring tools showed me the real-world effort needed to keep data secure and accessible.

AHMAD ADIB ZIKRI

What I got from the visit is the new style for me to keep the data server running without error or problem. UTHM use hot and cold aisle cooling system to keep the server run. Not to mention, they are still develop and not finish yet the Enterprise Architecture which is taken so long. So, the hardware use to keep data secure not only need to be known the material is but also how it work.
